Manuel de Jesús Cardoza Cardoza

Senior Backend & API Platform Engineer

PROFILE

Backend engineer with more than seven years on mission-critical systems for banking, fintech and regulated environments.

I am Manuel Cardoza, a Systems and Computer Engineer (Universidad Dr. Andrés Bello). My foundation is Java (8 to 17) with Spring Boot and Spring Cloud, and API-driven architectures that are secure, scalable and well governed.

I design and govern enterprise APIs with Apigee: routing, security policies, traffic management, versioning and backend integrations. I work as a cloud developer on AWS, Azure and Google Cloud, with microservices, distributed systems and event-driven architectures (Kafka, RabbitMQ, JMS), and I integrate legacy systems (AS400, COBOL, MQ Series) through REST, SOAP and GraphQL services secured with OAuth2, JWT and RBAC.

PROFESSIONAL EXPERIENCE

Client infrastructure omitted for confidentiality.

Jan 2024 - present — Microservices and APIs for central banking

- **Role:** Senior Software Engineer
- **Organisation:** PBS Consulting (project for BCR)
- **Technologies:** Java, Spring Boot, Spring Security, OAuth2, JWT, Docker, Kubernetes, CI/CD

Secure microservices and APIs for critical banking operations. I design, build and roll out scalable, high-performance backend services with Spring Boot, with REST APIs secured with OAuth2 and JWT to protect sensitive financial data. I tune data structures and queries on SQL and NoSQL databases that handle high transaction volumes. I take part in modernising services towards containers and managed Kubernetes in the cloud, with secure secret management and CI/CD pipelines that speed up delivery without losing quality. I diagnose and fix production incidents to keep mission-critical systems available. I build dynamic reports in Java with multi-format export and document solutions to quality standards (Javadoc and architecture diagrams). I work in cross-functional Scrum teams: sprint planning, daily stand-ups and reviews.

Aug 2025 - Oct 2026 — Hybrid fiat and crypto financial platform

- **Role:** Tech Lead
- **Organisation:** Monetae
- **Technologies:** Java, Spring Boot, WebFlux, OpenAPI, AsyncAPI, Kafka, Docker, Kubernetes

Technical leadership of a fiat and crypto financial platform. I led its development end to end with Scrum, hexagonal architecture and Clean Architecture. I designed high-concurrency distributed systems with Spring Boot and WebFlux, with enterprise security based on OAuth2 and OpenID Connect. I defined and adopted a contract-first approach with OpenAPI and AsyncAPI to standardise the APIs and the communication between microservices. I designed financial and transactional flows that ensure consistency, traceability and compliance in critical operations. Event-driven architecture with asynchronous messaging, distributed state and real-time communication, and resilience patterns: idempotency, retries with backoff, dead-letter queues and eventual consistency. Cloud-native deployment with containers and Kubernetes, secure secret and configuration management, observability with centralised logs, metrics and tracing, and OWASP security standards. I integrated external services for institutional custody, identity and digital asset processing. I took part in strategic decisions with business and product, coded hands-on every day, reviewed code, mentored the team and documented

the architecture and technical decisions.

May 2022 - Jan 2024 — Core banking integration with REST and SOAP services

- **Role:** Java Broker Developer
- **Organisation:** Banco Agrícola
- **Technologies:** Java, Spring Boot, Spring Batch, REST, SOAP, JMS

Core banking integration in Java through REST and SOAP. I designed, built and maintained integration solutions that keep communication between critical systems stable and secure. I implemented Spring Boot microservices between internal and external applications, improving scalability and resilience. I developed batch processes that transform and validate the core system's files to protect the integrity of financial data, and integrated legacy applications through custom connectors and queue-based messaging. I exposed banking features to third parties with REST and SOAP services under strict security and reliability standards. I optimised high-volume integration processes, improving response times and resource usage. I took part in migrating monolithic applications to microservices without service disruption. I ensured quality with unit tests, continuous integration and code reviews in Scrum and Kanban teams, working with the infrastructure, networking and QA teams.

2018 - 2022 — Systems and Computer Engineering degree

- **Organisation:** Universidad Dr. Andrés Bello

Degree in Systems and Computer Engineering. During my studies I already worked on banking projects, with Java, relational and non-relational databases and backend integrations with the core banking system.

Nov 2020 - Feb 2021 — Real-time electoral systems

- **Role:** Learning Facilitator
- **Organisation:** Supreme Electoral Tribunal of El Salvador
- **Technologies:** Java, Spring Boot, Angular, React

Technical coordination of the national elections' systems. I coordinated technical teams to roll out and deploy real-time electoral systems. I prepared training material and gave technical and operational training to electoral staff in hands-on sessions. I ran integration testing, functional validation and continuous monitoring before and during the elections to keep the systems reliable, stable and available. I contributed to the design of accessible, easy-to-use interfaces for diverse citizen profiles. I worked alongside the cybersecurity teams to reduce risk. I developed backend and frontend components for internal support modules with Java, Spring Boot, Angular and React. I took part in the post-election analysis, using technical and operational metrics to propose improvements for future processes.

Jun 2019 - Dec 2019 — Secure, event-driven banking applications

- **Role:** Full Stack Developer
- **Organisation:** Banco Davivienda
- **Technologies:** Java, Spring Boot, OAuth2, Apache Kafka, RabbitMQ, Docker

Secure banking applications with Java and the Spring ecosystem. I designed and built modular applications with Spring Boot, Spring Data and Spring Security, focused on scalability, maintainability and data protection. REST microservices with OAuth2 and JWT authentication for high-volume distributed operations. Event-driven services with Kafka and RabbitMQ for real-time transaction flows. I optimised relational and NoSQL databases to speed up queries and support concurrent operations. Container deployment with continuous integration and delivery pipelines that include validation and testing. Third-party integrations through REST and SOAP, aligned with financial industry regulation. I took part in architecture design meetings, reviewed code and mentored junior developers, in Scrum and Kanban teams.

FEATURED PROJECT

2026 - present — SaaS portfolio platform with an AI assistant

- **Role:** Design, development and operations
- **Organisation:** Personal project · open source
- **Technologies:** Java, Spring Boot, Angular, PostgreSQL, pgvector, Redis, Gemini, Docker, Google Cloud Run, GitHub Actions

Full-stack platform with a contract-first API, hexagonal architecture and an AI assistant that cites the source code. Spring Boot API with OpenAPI, cache-aside caching with Redis and a RAG assistant on pgvector and Gemini (github.com/JCardzZ/saas-portfolio). Deployed on Google Cloud Run and Cloudflare Pages with CI/CD on GitHub Actions: tests, security scanning (Trivy, CodeQL, gitleaks), a cosign-signed image with an SBOM, and keyless deployment with Workload Identity Federation.

SKILLS

- API design and governance with Apigee: routing, security policies, traffic management and versioning.
- REST, SOAP and GraphQL services with Java and Spring Boot; contract-first with OpenAPI and AsyncAPI.
- Cloud: AWS (ECS, EKS, Lambda, API Gateway, RDS), Azure (AKS, Key Vault, DevOps) and Google Cloud.
- Messaging and events: Kafka, RabbitMQ, JMS and IBM MQ Series.
- Integrating legacy systems (AS400, COBOL, MQ Series) with modern APIs.
- Security: OAuth2, OpenID Connect, JWT, RBAC and OWASP standards.
- Databases: PostgreSQL, Oracle, SQL Server, MySQL, MongoDB, Redis and DynamoDB.
- Docker, Kubernetes and CI/CD with Jenkins, GitHub Actions, Azure DevOps and GitLab CI/CD.
- Observability: Prometheus, Grafana, ELK Stack and SonarQube.
- Patterns: hexagonal architecture, Clean Architecture, Circuit Breaker, CQRS and Event Sourcing.

EDUCATION

- 2018 - 2022: Systems and Computer Engineering, Universidad Dr. Andrés Bello.
- Google Cloud Skill Badges: Develop Serverless Applications on Cloud Run; Deploy Kubernetes Applications on Google Cloud; Develop Serverless Apps with Firebase.
- Courses: microservices architecture with Java and GCP; backend development; master's in Java with backend and cloud infrastructure; master's in cloud with AWS, Azure and GCP.
