Manuel de Jesús Cardoza Cardoza

Backend Developer

PROFILE

I am Manuel Cardoza, a Systems and Computer Engineer (Universidad Dr. Andrés Bello, Chalatenango, 2023) and backend developer. Most of my work has been on banking projects: microservices with Java and Spring Boot, integrations with the core banking system on IBM AS400, and cloud deployments on Azure, AWS and GCP.

I turn business problems into technical flows and into software running in production. My foundation is the backend (Java and the Spring ecosystem), and I also work on the frontend with Angular, React and Vue.js. I have more than four years of experience in banking systems architecture, with agile methodologies (Scrum, Kanban) and tools such as Azure DevOps, Jira and Jenkins.

PROFESSIONAL EXPERIENCE

2024 - present — Modernisation of BCR services

- **Role:** Backend Developer
- **Organisation:** PBS Consulting (project for BCR)
- **Technologies:** Java, Spring Boot, PostgreSQL, AWS, Azure AKS, OAuth2, JWT

Since January 2024 I have been building microservices and the backend of strategic projects for BCR, at banking and enterprise level. The work includes modernising services, deploying them on managed Kubernetes (Azure AKS) and securing the APIs with OAuth2 and JWT.

2023 — Systems and Computer Engineering degree

- **Organisation:** Universidad Dr. Andrés Bello, Chalatenango

Degree in Systems and Computer Engineering. During my studies I already worked on banking projects, with Java, C# and PHP, relational and non-relational databases, and backend integrations with the core banking system on IBM AS400.

2022 — Integrating the AS400 core banking system with REST and SOAP services

- **Role:** Java Broker Developer
- **Organisation:** Banco Agrícola
- **Technologies:** Java, Spring Boot, IBM AS400, COBOL, IBM MQ Series, Spring Batch, Azure Functions, AWS Lambda, AWS SQS, Prometheus, ELK

Development of REST and SOAP services integrated with the broker and with the core banking system on IBM AS400: AS400 flat-file messages exposed as Spring Boot APIs, messaging with MQ queues and serverless components in the cloud, monitored with Prometheus and ELK.

2020 — Decoupling the decision engine from Colombia to El Salvador

- **Role:** Backend Developer
- **Organisation:** Banco Davivienda
- **Technologies:** Java, Spring Boot, Oracle, Apache Kafka, RabbitMQ, Docker, Kubernetes

Backend development on the project that decoupled the decision engine from Colombia to El Salvador, with Spring Boot services on Oracle, messaging with Kafka and RabbitMQ, and container-based deployment.

2019 — Integration of the voting system

- **Role:** Technical Facilitator

- **Organisation:** Tribunal Supremo Electoral (Supreme Electoral Tribunal of El Salvador)
- **Technologies:** Java, AWS, Azure, Angular, React

Integration of the voting system and technical training for its users. Real-time electoral systems, with attention to cybersecurity and protection against denial-of-service (anti-DDoS) attacks.

SKILLS

- REST and SOAP services with Java and Spring Boot, with versioning of every API.
- Messaging: JMS, MQ queues, Azure Service Bus and Kafka.
- Integration of AS400 flat-file messages with Spring Boot APIs; JNDI connections.
- Cloud microservices (Azure, AWS, GCP), SOA architecture and integration patterns.
- SQL and NoSQL databases: MySQL, SQL Server, PostgreSQL, Oracle, MariaDB, Cassandra, Redis, Firebase, DynamoDB and Cosmos DB.
- CI/CD and version control with Azure Repos, GitHub, Bitbucket and SVN.
- High-level UML diagrams, technical analysis with the areas involved, user acceptance testing (UAT) and support across development, QA and production environments.

EDUCATION

- 2023: Systems and Computer Engineering, Universidad Dr. Andrés Bello (Chalatenango).
- Courses: microservices architecture with Java and GCP; backend development; master's course in Java with backend and cloud infrastructure; master's course in cloud with AWS, Azure and GCP.
